Chapter 1

AMS & CMS Database Schema

This document outlines the database Views and Tables for Altiris Service & Asset Management Suite and Altiris Client Management Suite. This information is provided for your use in creating reports using the Notification Server Report Builder (see <http://kb.altiris.com/article.asp?article=27167&p=3>).

Note

If you build reports without using the Notification Server Report Builder, you will lose Notification Server security. We recommend that you build all reports using the Notification Server Report Builder.

Important Note to Readers

All tables listed in this document are for informational use only. They are not published interfaces to the Notification Server database. They are subject to change. Future releases may not maintain backward compatibility to the table interfaces.

- All tables, except DataClass tables, should only be used by the Notification Server internally.
- All views with their names prefixed "v" (example: vComputer) may be used by external parties.
- Views without the "v" prefixed are for 5.5 backward compatibility support only and therefore should only be used by the Notification Server internally or by Solution development.
- All DataClass tables, with prefix "Inv_" or "Evt_" may be used publicly to access resource data.
